

Shuru Technologies- Coding Challenge - Backend Development Guidelines

1. This coding round will be conducted online, which means you will need to share your screen during our virtual meeting. This approach allows us to observe your process and offer real-time assistance if needed.
2. This particular coding round focuses on backend development, specifically on the creation of several APIs. As a participant, we expect you to design the API, determine the appropriate supporting schema, and manage the use of the database accordingly.
3. An added advantage for your evaluation would be your ability to write unit tests for your code. This showcases your ability to ensure the integrity and reliability of your software, an essential skill in any development environment.
4. You are encouraged to make full use of resources available on the internet, such as Google, for any research or references that you may need during the coding round. We understand the value of these resources in resolving challenges and aiding in problem-solving
5. While completing the problem is certainly important, it is not the main objective of this exercise. We are more interested in evaluating your coding style, problem-solving skills, and the overall thought process behind your work.
6. Considering the time constraint of 90 minutes for this round, we strongly recommend preparing a boilerplate in your chosen language and tech stack before the session. This would help us bypass the initial setup time during the call, allowing more time to focus on the task at hand.

Please remember that this exercise is about showcasing your abilities and potential, and it's okay if you don't get everything perfect. We're excited to see your approach and creativity in problem-solving.

All the best :)
